ROTATING DRUM FILTRATION SYSTEMS (RDFS SERIES) WITH FILTERING FABRIC

Our RDFS series are used in mechanical machining for the filtration of coolants and liquids containing all types of contaminating particles. The type of filtering fabric used determines the degree of filtration. The circumference and width of the system provides a large filtering surface and allows significant capacities in reduced spaces. These type of filtration systems are suitable for the filtration of coolants (emulsions or whole oils) used on machine tools with chip removal, with tool for abrasion, in grinding machines, on transfer machines, work centres, drawing, lapping and honing machines, etc. They are also suitable for the filtration of washing and machining waters in industrial production processes such as washing machines, quenching waters, painting waters, etc. The filtration system RDFS series can be fitted individually, assuring an excellent efficiency, but can also combined with any type of filtration systems to obtain the grade of filtration desired, for example magnetic separators with disks.

RDFS series is suitable for capacities of 20 to 3.000 l/min.

Can be fitted to single machines or centralised systems.
